

METHOD AND APPARATUS FOR TEST AND REPAIR  
OF marginally functional SRAM cells

ABSTRACT

5 A method of manufacturing a device having embedded memory including a plurality of memory cells. During manufacturing test, a first test stress is applied to selected cells of the plurality of memory cells with a built-in self test. At least one weak memory cell is identified. The at least one weak memory cell is repaired. A second test stress is applied to the selected cells and the repaired cells with the built-in self test.
